My chief concern is about habitat and the other species trying to coexist with humanity. therefore my primary concern is for you to take the least disruptive route. Common sense says to use the existing routes but I understand those alternatives have been deemed unacceptable due to Oregon Trail protection and not mixing electricity and gas.

That being said I strongly suggest no action until the fast advances and changes in energy delivery that are now happening have been fully considered. transmitting energy over long distances from central points seems foolish. Localizing renewable energy sources makes most sense.

If the project does continue, I suggest the alternate Glass Hill Road route as least disruptive.
